

Book Products online

Products are available in the online store. User purchase products from the store. He purchases one product at a time.

Create the following table

Product Table: ID, Product Name, Cost, Quantity

Order Table: OrderID, Customer Name, Address, Phone number, ProductID, Required Quantity, Final Price

Create a page and give user option to provide customer name, address, phone number, product id and required quantity. Calculate Final price and display Final price and auto generated order id.

Create another page to search order details. Provide option to search by order id and display customer name, address, phone number, product name, required quantity and final price. Provide option to change the required quantity and delete an order.

Write a procedure to display product name, number of order.
